

Assignment 2

Model Upgrade &

Equity Research Enhancement

Improve FinRobot by upgrading base models and incorporating

Claude-inspired equity research skills into a multi-agent framework.

ASSIGNMENT	TRACK	DUE DATE	DELIVERABLES
02 / 02	FinRobot Equity AI	April 20, 2026	Reports + Blog Post

GITHUB REPOSITORY

github.com/AI4Finance-Foundation/FinRobot

01 Objectives

GOAL ONE

Upgrade the Base Models

Replace the original models in FinRobot with newer frontier LLMs — Claude, Gemini, Perplexity, or others — and evaluate how model choice affects reasoning quality, report consistency, and analytical depth.

GOAL TWO

Enhance Equity Research Skills

Study Anthropic's Financial Services Plugins (equity-research component) and extract design ideas to strengthen FinRobot's workflow — improving structure, reasoning steps, and analyst-style report sections.

02 Assignment Tracks

TRACK A Base Model Replacement

Experiment with replacing the original FinRobot model stack using stronger or more recent LLMs. You may assign the same model to all agents, or assign different models to different roles within the multi-agent system.

Candidates / directions:

Claude · Gemini · Perplexity ·
GPT-4o · Other frontier LLMs

TRACK B Equity Research Skills

Examine design ideas in Anthropic's equity-research workflow and adapt them into FinRobot. Do not simply copy the repository — extract useful ideas and re-implement them thoughtfully.

Candidates / directions:

Earnings analysis · Investment
thesis · Catalyst tracking · Risk
analysis · Report structure

Key principle: You are not just testing a different model. Both tracks must be addressed — model experimentation *and* a meaningful Claude-inspired enhancement to the research workflow.

03 What You Should Do

- 1 Replace the Base Models**

Modify the FinRobot pipeline so that it runs on updated models instead of the original configuration. Document your changes clearly and ensure reproducibility.
- 2 Experiment with Model Combinations**

Test different model-role assignments across the multi-agent system. For example: one model as the main analyst and another as the critic; or a unified model versus a mixed-model setup.
- 3 Improve FinRobot with Claude-Inspired Skills**

Add at least one meaningful enhancement based on ideas from Anthropic's equity-research workflow — such as a new research module, critique/revision stage, catalyst-tracking component, or stronger post-earnings analysis logic.
- 4 Prompt Refinement [optional]**

Rewrite prompts to better match each model's strengths and preferred interaction style. Thoughtful prompt engineering often has an outsized effect on output quality.
- 5 Compare and Analyze Results**

After generating reports, compare outputs across configurations: what you changed, what worked, what did not, which setup performed best, and why.

04 Required Companies

NVDA NVIDIA Semiconductors	AMD Advanced Micro Devices Semiconductors	INTC Intel Semiconductors	AAPL Apple Consumer Tech	GOOGL Alphabet Internet / AI
---	---	--	---------------------------------------	---

Additional companies from other sectors are encouraged to further evaluate pipeline robustness.

05 Deliverables

A

Equity Research Reports

Submit all reports generated by your improved FinRobot pipeline. Organize clearly by base model, model combination, or experiment setting.

by model · by combination · 5 companies

B

Brief Reflection

A Medium-style blog post covering: which models you tested, how you modified FinRobot, what Claude-inspired improvements you added, and key insights.

Medium-style blog · analysis · insights

06 Evaluation Criteria

#	Criterion	Description	Weight
01	Model Experimentation	Did you meaningfully test and compare different base models or model combinations?	
02	Claude-Inspired Enhancement	Did you successfully incorporate useful equity research ideas into FinRobot?	
03	Report Quality	Are the reports more coherent, analytical, structured, and financially useful?	
04	Depth of Analysis	Did you clearly explain why one configuration outperformed another?	
05	Engineering Quality	Is your pipeline modification clear, reproducible, and thoughtfully implemented?
